

Tecnoclean

Through a special chemical reaction, TECNOCLEAN is able to fuse with the silica that is present in both glass and ceramic glazes, to create a single layer on the surface, whereas traditional silicon products merely cover the surface.

As a result the treated surface becomes permanently WATER REPELLENT, and all other substances such as grease, dirt, calcium deposits and bacteria are washed away as the water is repelled from the surface. Microbiological analysis has shown that surface deposits of bacteria are noticeably reduced after treatment with TECNOCLEAN.

From an aesthetic point of view the treated surfaces will remain cleaner, and more brilliant looking for longer. The treatment also protects the surface from the clouding effects of calcium deposits, making it easier to clean, without the use of harsh and abrasive cleaners, and ensuring that the original transparency of the glass is retained.

The treatment is NON toxic and can be repeated without any risk, after the first signs of lime scale.

REMOV 50 GEL

On older surfaces before using TECNOCLEAN it is necessary to remove all calcium deposits from the surface using REMOV 50 GEL. **Please note;** that applying TECNOCLEAN to calcified surface will render the treatment ineffective.

KIT TECNOCLEAN

Contains; 125ml Tecnoclean, 125mm Remov, gloves, application sponge and instructions.
